

TRENDS IN THE PHILIPPINES

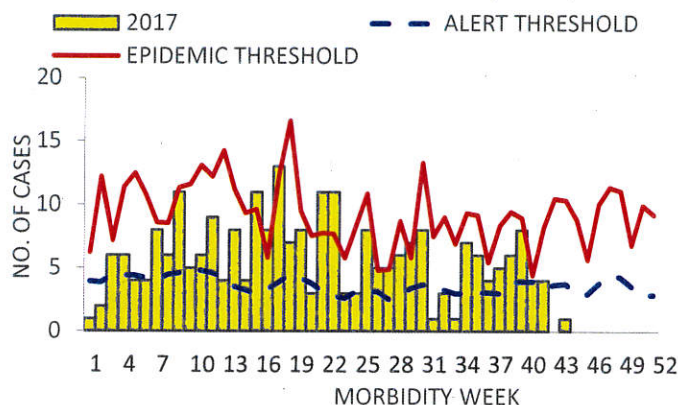

A total of **251** pertussis cases were reported nationwide from January 1 – November 4, 2017. This is **8.73% lower** than the same period last year (275 cases). Figure 1 shows the distribution of the reported pertussis cases in the country by morbidity week.

GEOGRAPHIC DISTRIBUTION

The number of pertussis cases varies by region. Figure 2 shows the distribution of reported pertussis cases by region in comparison to the same time period last year.

Table 1 indicates the reported pertussis cases by region in the Philippines. Fifty eight (23.11%) cases were confirmed out of 251 cases. Among the reported cases, 10 cases have died with a CFR of 3.98%. Majority of the reported pertussis cases came from NCR (73, 29.08%), Regions IVA (55, 21.91%) and XI (31, 12.35%). (See Annex A for case distribution by Barangay)

Fig. 1 Alert and Epidemic Thresholds and Reported Pertussis Cases by Morbidity Week, Philippines, as of November 4, 2017 (N=251)

Nine pertussis cluster⁽¹⁾ were identified as of November 4, 2017. No new cluster⁽¹⁾ of pertussis cases identified within the past 4 Morbidity Weeks. (See Annex B for case distribution by Cluster⁽¹⁾)

Fig. 2 Reported Pertussis Cases by Region, Philippines, as of November 4, 2017 (N=251)

PROFILE OF CASES

There are **125 (49.80%) females and 126 (50.20%) males**. Most (58.57%) of them belonged to the **0 to 3 months old age group**. One hundred twenty eight (51.00%) cases were not administered with any dose of DPT/pentavalent vaccine.

As shown in Figure 3.1, 80 (63.49%) out of 126 reported male pertussis cases belonged to the 0 to 3 months old age group and 63 (50.00%) did not received any dose of DPT/Pentavalent. Whereas in Figure 3.2, majority of the reported female diphtheria cases, 67 (53.60%) of them belonged to the 0 to 3 months old age group and 65 (52.00%) of them did not received any dose of DPT/Pentavalent.

Fig. 3.1 Reported Male Pertussis Cases by DPT Doses and Age Group, Philippines, as of November 4, 2017 (n=126)

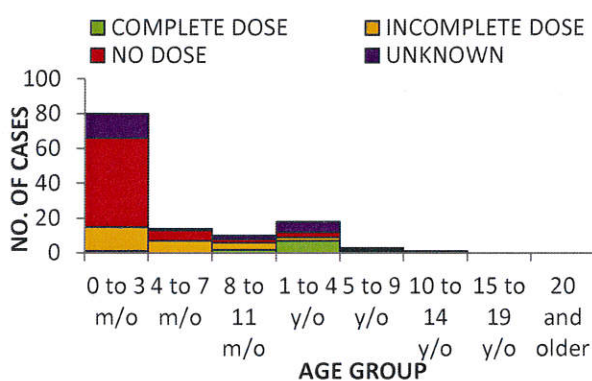

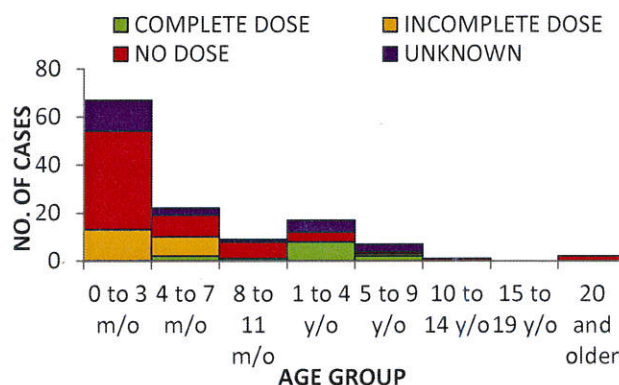

Fig. 3.2 Reported Female Pertussis Cases by DPT Doses and Age Group, Philippines, as of November 4, 2017 (n=125)

Standard Case Definition of Pertussis

• **Clinical Case:**

- A person with a cough lasting at least 2 weeks with at least one of the following:
 - paroxysms (i.e. fits) of coughing
 - inspiratory “whooping”
 - post-tussive vomiting (i.e. vomiting immediately after coughing)
 - without other apparent cause

Case classification

• **Clinically-confirmed case:**

- A case that meets the clinical case definition but is not laboratory confirmed.

• **Probable case:**

- Meets the clinical case definition, is not laboratory confirmed, and is not epidemiologically linked to a laboratory-confirmed case.

• **Laboratory-confirmed case:**

- A case of acute cough illness of any duration with a positive culture for *B. pertussis*; OR
- A case that meets the clinical case definition and is confirmed by PCR; OR
- A case that meets the clinical definition and is epidemiologically linked directly to a case confirmed by either culture or PCR.
