The Disease Intelligence Center of the Department of Health in line with its functions, and always aware of the major role that Health Statistics plays in Public Health, takes pleasure in presenting this report - Philippine Health Statistics, 1975.

This report represents the final statistical data collected on Births, Deaths, Foetal Deaths and Notifiable Diseases as they were registered and reported during the year 1975. Starting with this report, and in line with a collaborative and coordinated effort in the field of Vital Statistics, the statistical data on Births, Deaths and Foetal Deaths as well as population estimates were provided by the Office of the Civil Registrar General and the National Census and Statistics Office. Data on Notifiable Diseases were collected through established mechanisms of reporting by all field health personnel throughout the country. The data from these two sources have been summarized, sorted, analyzed and interpreted. Such meaningful information extracted is presented in tables and where appropriate, also in graphs, and published in this report as well as in other publications of the Disease Intelligence Center, which are disseminated to the health administrators at various levels.

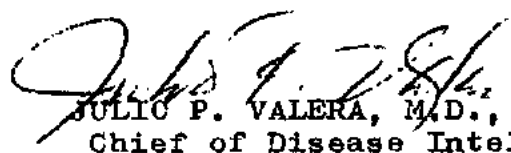

The coverage and presentation of this report are essentially similar to the 1974 report. Statistical tables, graphs and diagrams presented are based on data on registered births, deaths and foetal deaths and reported cases of notifiable diseases for the calendar year 1975. Some rate tables, graphs and diagrams present data since 1925; some give figures for the past 5 years, while most tables and graphs pertain to 1975 only. Population figures used for the computation of statistical indices and constants are also incorporated in this report.

This report is organized and presented as follows:

1. Introduction: Sources, classification, analysis and interpretation of data
2. Natality Statistics: Text by subject and related tables, graphs and diagrams
3. Notifiable Diseases: Text by subject and related tables, trends of cases & deaths
4. Mortality Statistics: Total, infant, maternal & foetal: text by subject and related tables, graphs and diagrams.

It is hoped that this annual report on Philippines Health Statistics will provide those concerned with the prevention and control of diseases and the promotion, protection and maintenance of the health of the nation, the necessary statistical basis for the planning, implementation and evaluation of health programs and services.

Grateful acknowledgements are due the Director, National Census and Statistics Office (who is also the Civil Registrar General) for the collaboration and support extended specifically in the provision of vital statistical data, and to all the field health officers throughout the country, for their active participation in the collection of morbidity and mortality data on Notifiable Diseases.

28. Foetal Mortality: By Attendance, Percentage Distribution, Philippines, 1975	311
29. Foetal Mortality: With Medical Attendance, Percentage Distribution, Philippines, 1975	311

INTRODUCTION

A. SOURCES OF DATA

1. Live Birth, Death and Foetal Death Statistics - Effective March, 1973 a collaborative program was drawn with the National Census and Statistics Office whereby that Office shall provide basic tabulations on births and deaths thereby making it possible for the Disease Intelligence Center to discontinue its collection and mechanical processing of such data. Raw data on births, deaths and foetal deaths were taken from the said Office. The basis of the registration of vital events is Act No. 3753 otherwise known as the Civil Registry Law. By virtue of Commonwealth Act 591, the Director of the Bureau of Census and Statistics (now the Executive Director of the National Census & Statistics Office) concurrently is the Civil Registrar-General and all local civil registrars are under his supervision. In the cities, the local civil registrars are the officials designated in their respective city charters generally the city health officers, while in regular municipalities and municipal districts, the local civil registrars are the municipal treasurers and municipal district treasurers, respectively. Each vital event is registered in the office of the local civil registrar of the locality where the event occurred and a copy of each document is sent to the office of the Civil Registrar-General within the first ten days of the succeeding month.

2. Notifiable Diseases Statistics - Data on Notifiable Diseases are based on information gathered by field health personnel. The Law on Reporting of Notifiable Disease (Act 3573) provides that any case of notifiable disease shall be reported immediately to the nearest health officer. All field health officers by means of a established reporting mechanism (Memorandum Order No. 51-a, s. 1960) submit through the Provincial and City Health Officers, collective morbidity reports (DIC Form No. 2) weekly to the Disease Intelligence Center where such data received are then edited, classified, compiled, analyzed and interpreted.

3. Population Statistics - The official population estimates since 1925, as computed by the National Census and Statistics Office, using the geometric method, are presented in the report. The bases for the yearly population figures are the censuses of 1918, 1939, 1948, 1960, 1970 and 1975. The 1975 population for the Philippines, and each region, province and city were estimated from the latest census (1975) which indicated an annual rate of increase of 2.86%.

B. CLASSIFICATION OF DATA

Classification of health statistics and population statistics must be made according to similarly defined system and tabulated in comparable groups in order to make use of the principal value of both data. Thus, variables common to both, i. e., geographic area, age and sex have been similarly classified and tabulated in this report.

1. Geographic Classification - Live births; deaths from all causes; infant, maternal and foetal deaths; and data on notifiable diseases have been classified by place of occurrence - region, province and city - the first being a geographical division created as a result of the reorganization of the Department of Health and the other two being political divisions of the country. There are twelve (12) regions, seventy-two (72) provinces and sixty-one cities. There is no classification of the place of occurrence as to whether it is rural or urban because of the lack of standard criteria.

2. Age - There is no valid information with regards to the accuracy of age of a reported morbid case. Regarding registered deaths; the age of the deceased is fully determined by the date of birth. However, some of the vital records are filled with the age not recorded or the data of birth not indicated. Thus, misstatement of age on vital records maybe assumed to some degree. The age classification used in this report is consistent with those recommended for international use by the World Health Organization.

3. Diseases and Causes of Deaths - Morbidity and mortality statistics published by the Department of Health are classified and tabulated in accordance with the International Classification of Diseases, Injuries and Causes of Death, 8th Revision. In this report, the 3-digit classification was used for morbidity as well as for total mortality statistics, while the 2-digit classification was used for foetal deaths.

4. Sex - Classification by sex is made in relation to other factors such as age, nationality, date and place of occurrence. Thus, some tabulations presented in this report may be considered as four-fold tables with sex as one of the attributes of classification.

C. ANALYSIS AND INTERPRETATION OF DATA

Health statistics are very useful for a variety of administrative and research purposes. However, they can not correctly be interpreted unless pertinent qualifying factors, aside from the method of classification, are taken into consideration.

Some of the factors limiting the use of the statistical data emanate from discrepancies in the original records or from the impracticability of tabulating these data in very detailed items. While these defects do exist, nevertheless, the value of these data for general purposes is indispensable. The exact evaluation of health statistics or the analysis of small differences necessitates careful study of a variety of related elements. However, the major trends and differences may not be altered materially by finer analysis.

1. Small Frequencies - The number of births and deaths reported for an area or community, or the number of ailments, represents complete counts of such events. Such being the case, they are not subject to sampling errors although they are subject to errors in the registration process or reporting system. When data are used for analytical purposes, as for example, the comparison of rate over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have arisen under the same circumstances. In accordance with certain statistical assumptions, the probable range of values may be estimated from the actual figures.

2. Computation of Statistical Indices - In the computation of statistical indices for the Philippines and each health region, province and city, the standard formula are used. Thus, the crude birth and death rates are per 1,000 population; the infant, neonatal, maternal and foetal death rates are per 1,000 live births; and the specific disease morbidity and mortality rates classified either by age, age or sex are per 100,000 population.

4.

3. Completeness of Registration and Notification - In the Philippines, although the law provides for a compulsory registration of births, deaths and foetal deaths (Act 3753) and the reporting of Notifiable Diseases (Act 3573) there are deficiencies in the observance of the law due to a variety of factors.

Tests for completeness of birth and death registration made in 1956 in the province of Nueva Ecija, indicated an underregistration of births by more than 30% and deaths by more than 10% for the whole province. A more recent and more extensive survey on the completeness of death registration in all the provinces (32) and cities (18) of Health Regions 1, 2, 3, and 4, and one province each in Regions 5 and 6 was conducted in 1961-1962. This revealed that of the randomly selected names of persons buried in cemeteries in more recent years (1959-1962), 27.3% do not appear in the Death Registers of the Local Civil Registrars.

In view of the limited scope of these two studies, the percentage of underregistration cannot be made to apply on a nationwide basis. Corrections for underregistration may only be made after the latter survey has been completed for the whole country. At any rate, it is grossly evident that incomplete registration of births, deaths and foetal deaths is still a problem in many areas in the country.

Completeness in the reporting of Notifiable Diseases varies greatly by disease and by area. In general, and from all indications, reporting is apparently incomplete.

4. Population Bases - In order to insure statistical comparability, the vital and health statistical indices presented in this report for the Philippines and each health region, province and city were computed using the official population estimates of the National Census and Statistics Office, which were based on the latest census (May 6, 1970).

5. Allocation of Vital Events - All data in this report were tabulated according to place of occurrence and not by place of residence. Philippine laws provide that all vital events and cases of notifiable diseases must be registered and reported, respectively, by place of occurrence.

PHILIPPINE HEALTH PICTURE

1925 - 1975

	<p>POPULATION</p> <p>INCREASED FROM 11,665,500 TO 42,517,300 264.5 % INCREASE</p>

NATALITY STATISTICS

All birth statistics tabulated and presented in this report are based on information received by the Office of the Civil Registrar General from all Local Civil Registrars throughout the Philippines.

In 1975, a total of 1,223,837 live births was registered. This number is 142,764 more than the 1974 figure.

The crude birth rate of 28.8 in 1975 is 2.7 more than that of 1974 or a 10.3% increase. The average birth rate for the past 10 years (1966-1975) is 26.6% per 1,000 population. While the population has increased by 264.5% since 1925, improvement in birth registration during this period was not consistent with the tremendous population increase.

The figure of 1,223,837 represents the total number of live births registered in 1975 and does not necessarily represent the actual total number of babies born alive in that year; and since there is no measure of underregistration of births which is valid for the whole country, no corrections were made for such.

Trend of Crude Birth Rate - The number of live births registered and the corresponding birth rates for the past 50 years (since 1925) are presented in this report (Table 4). During this period, the crude birth rate showed a general declining trend and the changes were rather slow and irregular during the later years. The 1925 rate was 33.2 per 1,000 population. This increased to 33.6 and 33.9 in 1926 and 1927, respectively. The rate was almost stable at 32 per 1,000 population from 1930 to 1940 with but slight variations in 1934, 1935 and 1937 when the rates were 31.1, 31.3 and 33.3, respectively. After World War II (1946), the crude rate was 28.9 and increased to 31.5 in 1948. It went down to 30.9 in 1949, only to increase again to 31.6 in 1950. An average rate of 30 births per 1,000 population was recorded from 1951 to 1956 except in 1953 when it slightly decreased to 29.7. In 1957 and 1958, the rates declined to 29.6 and 29.4, respectively, but in 1959 it increased to 30.0. From then on a declining pattern of the crude birth rate could be observed. However, in 1962, it increased slightly to 28.4. In 1965, the rate dropped to 27.0 birth per 1000 population only to increase but very slightly to 27.1 in 1966. A decrease was observed in 1967 when the rate went down to 26.3. In 1968, it rose to 26.8, to 27.3 in

1969 and to 27.4 in 1970. It declined to 25.4 in 1971 and to 24.8 in 1972, the lowest ever recorded. The 1972 figure scored to 26.1 in 1973 and remained stable at that rate till 1974. It went up to 28.8 in 1975.

Birth By Sex - Of the total 1,223,837 registered births in 1975, 638,237 are males and 585,600 are females, representing 52.2% and 47.8% of the total respectively. The proportion of the male births to the female births is still 1 male for every 0.9 female birth.

Births By Nationality of Parents - Birth statistics in this report are classified by nationality of parents as either Filipino, Chinese, American, Spanish and others. Of the total birth reported, 1,202,163 or 90.2% were of Filipino father and 1,221,328 or 99.8% were of Filipino mother; 1,201,381 or 98.2% were of Filipino parents. Only 2,217 or 0.18% were of foreign mothers and 4,185 or 0.34% were of foreign fathers.

However, the nationalities of the fathers and mothers of 17,489 and 292 births respectively, were not stated.

Births By Attendant - Of the 1,223,837 births registered for 1975, 559,587 (45.7%) had the benefits of medical attendance (Table 8). This figure shows a decrease of 2.7% over that of the previous year. It is observed that almost one-half of all the deliveries or 49.4% were not medically attended. Attendance to 59,882 births (4.9%) was not stated. Of those with medical attendance 270,763 or 48.4% were delivered by physicians, 29,861 or 5.3% by nurses and 258,963 or 46.3% by midwives. Health Region 4 had the highest percentage of births medically attended (67.4%) while Region 5 had the lowest (21.0%).

Births By Place of Delivery - As shown in Table 9, there were 950,648 births delivered in the homes and 273,189 delivered in the hospitals. These figures represents 77.7% and 22.3% of the total respectively. Of the twelve health regions, Region 4 reported the greatest percentage (43.3%) of hospital deliveries. This is due to the fact that more hospital are situated in this region. Even in the cities majority of the deliveries were in the homes. Of the cities, Manila reported the highest percentage of hospital deliveries (91.0%), while of the provinces, Rizal reported the highest percentage (34.6%).

Crude Birth Rates By Area - Table 5 shows that of the provinces, Davao del Norte registered the highest birth rate 39.5 births per 1,000 population, while Tawi-tawi, the lowest - 1.2. Of the cities, Trece Martires, registered the highest rate - 61.8 while Zamboanga City had the lowest - 3.8.

Of the different health regions, Region 11 registered the highest birth rate - 34.0 per 1,000 population while Region 9, the lowest rate - 16.7.

Variations in the crude birth rate in different places all over the country depend largely on the extent of the completeness of birth registration and do not necessarily depict the fertility of the people in those areas.

General Fertility Rate - The fertility rate of a country is measured in terms of the total number of live births per 1,000 female population of child-bearing age (15-44 years).

In 1975, the female population of such age group numbered 9,227,500 while the total live births registered was 1,223,837 representing a fertility rate of 132.6 which is 12.7 more than that of the preceeding year or an increase of 10.6%.

NOTIFIABLE DISEASES STATISTICS

Statistics on notifiable diseases presented and analyzed in this report were collected from the Morbidity Reports (DIC Form No. 2), received weekly from all provincial and city health officers throughout the country.

In accordance with Act 3573 (Law on Reporting of Notifiable Diseases), the following diseases must be reported to the nearest health station; Cholera, Plague, Smallpox, Yellow Fever, Gastro-enteritis and Colitis, Diphtheria, Dysentery (All Forms), Food Poisoning, Poliomyelitis, Typhoid and Paratyphoid Fever, Acute Infectious Encephalitis, Pneumonias, Filariasis, Gonococcal Infection, Infectious Hepatitis, Influenza, Leprosy, Malaria, Measles, Malignant Neoplasms, Rabies, Schistosomiasis, Syphilis, Tetanus, Tuberculosis (All Forms), Whooping Cough, Varicella and Acute Toxic Febrile Condition with Haemorrhage (H-Fever).

All the notifiable diseases in the Philippines are communicable except Malignant Neoplasms. The first four diseases mentioned in the law are quarantinable.

Trend of Notifiable Diseases - The incidence and mortality from notifiable diseases for the past 10 years (1965 - 1974) are shown in Table 16. It may be noted that deaths from notifiable diseases showed a continued declining trend, except Tuberculosis All Forms, Infectious Encephalitis, Malignant Neoplasms and Influenza which increased in 1974. The incidence of Typhoid and Paratyphoid Fever, Gonococcal Infections and Infectious Hepatitis showed a generally increasing trend during the 10-year period (1965 - 1974). Better diagnosis and improved notification were mainly responsible for the increase in the number of cases. On the otherhand, the incidence of Malaria, Rabies, Whooping Cough and Tetanus had generally decreased from 1965 to 1974. Measles and Influenza present irregular trends on account of outbreaks at almost yearly intervals. Malignant Neoplasms on the other hand has consistently increased in incidence and mortality.

Figure 19 presents the trend from 1925 to 1974, of the death rate from communicable diseases as a group in comparison with that of Malignant Neoplasms and Diseases of the Heart. It may be noted that while the mortality rate of communicable diseases presented a generally de-

creasing pattern, those of the Diseases of the Heart and Malignant Neoplasms showed distinctive increasing trends.

Leading Causes of Morbidity - The ten (10) leading causes of morbidity in 1975 and for the past 5 years (1970 - 1974) are shown in Table 11 and Figure 9. Of these diseases, three (3) are Broncho-Pulmonary (Pneumonias, Tuberculosis and Whooping Cough); Two (2) are gastro-intestinal (Gastro-enteritis and Colitis and Dysentery, All Forms); Two (2) are viral (Influenza and measles); one is parasitic (Malaria); one is bacterial disease (Tetanus); and one is non-communicable (Malignant Neoplasms). It has been noted that approximately 96% of illnesses due to Tuberculosis, are respiratory in nature, hence, they are included among the broncho-pulmonary diseases.

Seasonal Variations - The seasonal variations and expected limits of weekly incidence of selected notifiable diseases are shown in Table 15. Cholera El Tor, Gastro-enteritis and Colitis, Measles, Influenza, Diphtheria and Varicella showed definite variations of seasonal incidence.

The expected limits of the weekly number of cases are computed as follows: From the number of cases reported for each morbidity calendar week for the past 5 years, three central figures are selected by eliminating the highest and lowest figures. The average of the middlemost figure (median) and the highest of the three central figures is taken as the upper limit, representing the maximum limit for the expected weekly number of cases. The lower limit is the average of the middlemost figures and the lowest of the three central figures.

Age - The age distribution of the cases of notifiable diseases is shown in Table 13. Each disease has its particular distribution as to age. Some of them were mostly confined in the younger age groups such as Diphtheria, Measles, Whooping Cough, Varicella, Poliomyelitis, Acute Infectious Encephalitis, Gastro-enteritis and H-Fever. A few of them such as Tuberculosis All Forms, Leprosy and Malignant Neoplasms were confined to the older age groups. The rest of the notifiable diseases were almost evenly distributed among the different age groups.

Sex - The sex classification of the reported cases of notifiable diseases is shown in Table 13. It is noted that there was no significant sex difference among the cases, while in some age groups, the number of cases for either sex may be slightly higher than the other, yet sex

did not seem to play an important role in the incidence of these diseases.

Geographical Distribution - The notifiable diseases were almost evenly distributed throughout the country with a few exceptions. Schistosomiasis for instance was highly endemic in Health Region 8, 9, 10, 11 and 12; Filariasis was prevalent in Health Region 5, and 11; Malaria affected mostly the hinterlands and newly opened settlement areas. As Shown in Table 12 practically the same disease problems were present on all eleven health regions in the country.

Quarantinable Disease - Of the four quarantinable diseases, only Cholera El Tor is present in the Philip - pines. In 1975, there were 1179 reported cases and 290 deaths, giving a morbidity rate of 2.8 and mortality rate of 0.7 per 100,000 population, respectively.

MORTALITY STATISTICS

This represents mortality statistics based on data compiled from the death certificates submitted by the Local Civil Registrars throughout the Philippines to the Office of the Civil Registrar General.

A. GENERAL MORTALITY

A total of 271,136 deaths was registered in 1975. This figure represents a crude death rate of 6.4 per 1,000 population which is 5.9% lower than that of the previous year (1974).

Causes of Deaths, 1965 and 1975 - The ten leading causes of death in 1975 are presented in Table 19. Collectively, they accounted for 164,568 deaths representing 60.7% of deaths from all causes. The group consists of five (5) communicable diseases - Pneumonias, Tuberculosis, Gastro-enteritis, Bronchitis and Tetanus; two (2) degenerative diseases - Diseases of the Heart and Diseases of the Vascular System; one (1) nutritional disease - Avitaminoses and other deficiency States; and the rest are Malignant Neoplasms and Accidents. The first three (3) leading causes are Pneumonias with a rate of 102.0 per 100,000 population representing 16.0% of the total deaths; Tuberculosis, All Forms, with a rate of 69.2 or 10.9% of the total mortality and Diseases of the Heart with a rate of 56.6 or 8.9% of the deaths from all causes. Diseases of the Vascular System and Malignant Neoplasms ranked fourth and fifth with rates of 31.8 and 29.4, respectively. Gastro-enteritis and Colitis and Avitaminoses and other Nutritional deficiency occupied sixth & seventh positions with rates of 27.8 and 26.0, respectively. The last three in the group are Accidents (19.1), Bronchitis (15.2) and Tetanus (10.0).

The leading causes of death in 1965 are shown in Table 26 and Figure 20. During the year, Pneumonias was the leading cause with a rate of 121.2 per 100,000 population. Tuberculosis, All Forms (83.4) ranked second, Gastro-enteritis and Colitis (46.0) was third Bronchitis (43.1) ranked fourth and Diseases of the Heart was fifth in line with a rate of 33.6. The sixth and seventh positions were occupied by Beriberi (32.8) and Diseases of the Vascular System (27.9). The last three causes were Accidents (23.2), Malignant Neoplasms (22.2) and Nephritis and Nephrosis with a rate of (13.3) per 100,000 population.

It is clearly noted that during the ten-year period, (1965) to (1975), deaths from communicable diseases particularly some of those among the leading causes of deaths, except Diseases of the Heart showed marked decline. On the otherhand, the non-communicable diseases which include Malignant Neoplasms and Chronic Degenerative Diseases Like Cardio-Vascular Diseases have increased noticeably except Accidents Bronchitis death rate registered a decreased of 27.9 or 64.7% while Tuberculosis All Forms death rate decreased by 14.2 or 17%, Gastro-enteritis and Colitis death rate decreased by 18.2 or 39.6%. Death rate from Malignant Neoplasms showed an increase of 7.2 or 32.4% while that from Accidents decreased by 4.1 or 17.7%.

General Mortality Trend - Table 4 and Figure 4 show the trend of crude death rate for the country from 1925 to 1975. A marked decline in this rate from 17.7 per 1,000 population in 1925 to 6.4 in 1975 is observed. This represents a decrease of 11.3 or 63.8% over a period of 48 years. A slow and irregular decline in rate started in 1925 and continued until the outbreak of the Last World War. Data on health statistics were not available during the war years. Post war rates continued to decrease until 1971 when an all time low death rate of 6.6 was attained followed by an increase to 7.3 in 1972 and a gradual decline to 7.0 and 6.8 in 1973, 1974 and 6.4 in 1975 respectively. The crude death rate in the country for the past four (4) decades is characterized by a general downward trend with slight troughs from 1938 to 1941 and 1950 to 1953.

Crude Death Rate By Area - Of the twelve health regions in the country, Region 7 registered the highest crude death rate of 7.9 per 1,000 population, while Region 12 had the lowest 2.3. The highest rate among the cities was recorded for trece Martires City (27.6) and the lowest was that for Cadiz City (2.3), Batanes topped all the provinces with the high rate of 9.7 while Tawi-Tawi had the lowest (0.2) which was of course due to practically no registration.

Mortality By Age - Table 17 - shows the death from all causes by age, sex and percentage distribution. The highest percentage of death was recorded for those under 1 year (65,263) or 24.1% of all deaths while death among 10-14 years old represented the lowest percentage (1.8%). The age specific death

rate for age 70 years and over is the highest, 59.4 per 1,000 population followed by death rate for under 1 year (45.5). After infancy, the death rate decreased continuously as age increased until the minimum level of 1.0 was reached in the age group 10 - 14 years. After this age, the rate increased again for each successive age group until a peak was reached in the age group 70 years and over.

Mortality By Sex - In 1975, there were 153,505 male deaths and 117,631 female deaths. These figures represent 56.6% and 43.4% of all deaths, respectively. The mortality rate for males was 7.3 per 1,000 male population, while that of female was 5.5. The ratio is 1.8 male death to 1 female death.

B. INFANT MORTALITY

There were 65,263 deaths under 1 year of age registered in 1975. This figure represents 24.1% of all deaths. The infant mortality rate is 53.3 per 1000 live births which is lower than that of previous year by 5.4 or 9.2%. The infant mortality rate has receded to an all time low for the country in 1970 (59.3).

Infant Mortality By Cause - The ten leading causes of death under 1 year are shown in Table 28. These diseases caused 42,275 infant deaths representing 64.8% of the total infant mortality and 15.6% of the total deaths. Pneumonias, as in the past years caused the most number of deaths - 15,716 representing a rate of 12.8 per 1,000 live births and 24.1% of all infant deaths. Avitaminoses and other nutritional deficiency occupied the second position causing 8,200 deaths with a rate of 6.7 and represented 12.6% of all infant deaths, while Gastro-enteritis and Colitis ranked third with a rate of 3.5. The fourth and fifth leading causes are Anoxic and hypoxic conditions not elsewhere classified and Tetanus with rates of 3.3 and 2.7, respectively, Bronchitis, emphysema and Asthma ranked sixth with a rate of 1.7 while Congenital Anomalies ranked seventh with a rate of 1.3. Acute Respiratory Infection, Measles and Meningitis occupied the eighth, ninth and tenth positions with a rate of 1.3, 0.7 and 0.5 per 1,000 live births respectively.

Trend of Infant Mortality - The number and rate of infant from 1925 to 1975 are shown in Table 4. The infant mortality rate in 1925 which was 150.2 per 1,000 live births dropped to 53.3 in 1975. This represents a marked decrease of 96.9 or 64.5%. There were slight yearly decreases in the rates from 1925 to 1940. The

lowest pre-war rate recorded was in 1936. No data were available during the war years (1941-1945). After the war, the infant death rate curve showed an irregular but marked declining trend, reaching its all time low in 1975 (53.3).

Infant Mortality By Area - Infant mortality rates for the different health regions, provinces and cities all over the country are presented in Table 5. Region 8 had the highest rate of 77.1 per 1,000 live births while Region 11 had the lowest 33.0. Of the provinces, Northern Samar registered the highest rate (114.4), while Bukidnon recorded the lowest rate (26.8) due to incomplete registration. Of the cities, Zamboanga City had the highest (498.9) while Gingoog City had the lowest (23.1).

Infant Mortality By Age - Of the total 65,263 infant deaths registered in 1975, 29,882 deaths were under 28 days (deaths) and 35,381 were 28 days to under 1 year (post-neonatal deaths). These represent 45.8% and 54.2% of total infant mortality, respectively. Deaths totalled 8,646 representing 28.9% of neonatal deaths and 13.2% of all deaths under 1 year. The lowest number of deaths in the neonatal group occurred among those in the age - four days which registered 1,428 deaths or 1.2% of all neonatal deaths.

Of the deaths that occurred after the first month of life, those of age 11 months comprised the highest percentage with 7,649 deaths, representing a rate of 6.3 per 1,000 live births and 11.7% of the total infant mortality. Deaths under 28 days had a rate of 24.4 per 1,000 live births while the rate for those 28 days of life to under 1 year was 28.9.

Infant Death By Sex - There were more male deaths under 1 year of age than females. The rate for male was 48.5 per 1,000 population, while that of the females was 36.4. The infant death sex ratio is 1.3 male death for every 1 female mortality.

C. MATERNAL MORTALITY

In 1975, there were 1,753 maternal deaths registered. This represents 0.6% of the deaths from all causes and a maternal mortality rate of 1.4 per 1,000 live births. This rate is slightly lower than that of the previous year (1.6).

Maternal Mortality By Cause - Hemorrhage of pregnancy and childbirth, and toxemias of pregnancy and the puerperium were the major causes of maternal deaths with a rate of 0.8 and 0.3 per 1,000 live births, representing 54.9% and 18.9% of all maternal deaths, respectively. Other complications of pregnancy, childbirth and the puerperium and delivery without mention of complication had a rate of 0.2 per 1,000 live births and caused 13.1% of all maternal deaths.

Trend of Maternal Mortality - A significant decline in the maternal mortality rate from 1930 to 1975 is shown in Table 4. The 1930 rate of 7.8 went down to as low as 6.3 per 1,000 live births in 1940. No. data were available during World War II. The declining trend continued after the war until it reached 2.4 in 1960. A slight increase was observed in 1961. However, this increase was followed by a noticeable drop to 2.0 in 1965 to 1967. The lowest so far recorded was in 1971 (1.3) followed by a slight increase to 1.4 in 1972, 1973, 1974 and 1975 (1.4).

D. FOETAL DEATHS

There were 13,764 foetal deaths registered in 1975 representing a foetal death rate of 11.2 per 1,000 live births. This figure represents a 5.8% decrease over that of 1975.

Different causes of foetal deaths in the country are shown in Table 33-A. The first three leading causes are the following: Anoxic and hypoxic conditions not elsewhere classified with a rate of 1.1; Conditions of Placenta (1.2) and Immaturity Unqualified (1.1).

Region 4 reported the highest number of foetal deaths - 4,341 or 31.5% of all foetal mortality. Region 12 reported the least number 228 or 1.7%. The highest regional foetal death rate recorded was in Region 1 - 14.3 per 1,000 live births and the lowest was that of Region 12 (6.8).

Foetal deaths that were medically attended totalled 11,996 (87.2%) broken down as follows: by Physician - 6,076 or 50.6%, by hospital authorities 5,317 or 44.3% by midwives - 369 or 3.1% and by nurse 234 or 2.0%. A total of 1,083 or 7.4% deaths was not given medical attendance while attendance to 745 or 5.4% of all foetal deaths was not stated at all in the Foetal Death Certificate.
