TECHNICAL NOTES ON THE 1994 *PHS*

The 1994 *Philippine Health Statistics (PHS)* covers the second year of decentralization of health services to local governments under the Local Government Code (Republic Act 7160). This edition relies on reports from the local civil registrars as indicated in the Field Health Service Information System reports (FHSIS) of DOH's Health Intelligence Service and National Statistics Office natality and morbidity statistics.

Population projections and recommended infant mortality rates, child mortality rates, under-five mortality rates and maternal mortality rates are derived from the National Statistical Coordination Board (NSCB). The *PHS* also uses vital events (live births, deaths and fetal deaths) as reported by local civil registrar to the National Statistics Office. As you may note, projections from the NSCB show higher IMRs than those reported by the civil registrars because of corrections made by the NSCB for underreporting of vital events. The users of these data are thus advised to indicate properly the source of the statistics they report, to avoid confusion.

This 1994 *PHS* includes features that are meant to assist users:

1. The Autonomous Region of Muslim Mindanao (ARMM) is covered here, by virtue of its operation in 1993. The regional reports for ARMM are derived from the four provinces that compose it: Lanao del Sur, Maguindanao, Sulu and Tawi-tawi. Regions 9 and 12 have thus dropped these four provinces; however, Region 12 contains data from the cities of Cotabato and Marawi.

2. The National Capital Region (NCR) saw the creation of 4 new cities in 1994 namely; Mandaluyong, Pasig, Makati and Muntinlupa. The 4 districts that constitute the whole reporting units of NCR are composed of municipalities and cities. They are as follows: District I- Valenzuela, Malabon, Navotas; District II - Marikina, Pasig, Pateros, Taguig; District III - Makati City, Mandaluyong City and San Juan; District IV - Muntinlupa, Las Pinas, Paranaque.

3. A section of defining rates and ratios is included in this edition for the occasional user of statistics who may need quick reference to these while perusing the book in the library.

4. The tables on notifiable diseases have been divided into two tables: one table for cases reported by local health services and another for deaths recorded by the civil registries. The two tables cannot be directly linked since the reports are coming from two different sources.

The staff of the Health Intelligence Service who produce this book would like to encourage all readers to continue to give us feedback on our work. The benefits can only redound to the Filipino people, whom we continue to serve with diligence and pride.

NSCB RESOLUTION NO. 1-96

ADOPTION OF THE INFANT MORTALITY RATES, CHILD MORTALITY RATES, UNDER-FIVE MORTALITY RATES AND MATERNAL MORTALITY RATIOS, 1990-1995 AS INTERIM ESTIMATES AT THE NATIONAL, REGIONAL, PROVINCIAL AND CITY LEVELS

WHEREAS, the Technical Working Group on Maternal and Child Mortality (TWG-MCM) then Task Force on Infant Mortality was tasked to generate estimates on infant mortality rates (IMRs), child mortality rates (CMRs), under-five mortality rates (U5MRs) and maternal mortality ratios (MMRs) at the national, regional, provincial and city levels for the period 1990-1995;

WHEREAS, in undertaking the task, the TWG-MCM has tapped all relevant data sources such as the Field Health Service Information System (FHSIS), the Vital Registration System (VRS), the 1993 Listing of Households (HH List) in the sample barangays of the Integrated Survey of Households by the National Statistics Office (NSO) and the 1993 National Demographic Surveys (NDS);

WHEREAS, the TWG came out with recommended mortality estimates at the national, regional, provincial and city levels for the 1990-1995 using the methodology detailed in the Technical Notes;

WHEREAS, the TWG-MCM presented the methodology and the estimates to the Technical Committee on Population and Housing Statistics (TC-PHS) in its meeting held 19 November 1995;

WHEREAS, the TC-PHS subsequently endorsed the methodology and the estimates of the IMRs, CMRs, U5MRs and MMRs, 1990-1995 at the national, regional, provincial and city levels to the NSCB for its approval;

WHEREAS, in its meeting held 5 February 1996, the NSCB Board approved the methodology and the estimates of IMRs, CMRs, U5MRs and MMRs, 1990-1995 at the national, regional, provincial and city levels as official interim estimates;

NOW THEREFORE, BE IT RESOLVED AS IT IS HEREBY RESOLVED THAT the estimates of IMRs, CMRs, U5MRs and MMRs at the national, regional provincial and city levels for the year 1990-1995 as shown in the attached tables be adopted for planning and policy/decision-making purposes as interim estimates until such time that results of new censuses and surveys are made available.

INTRODUCTION

A. SOURCES OF DATA

1. LIVE BIRTH, DEATH AND FETAL DEATH STATISTICS

Effective March, 1973 a collaborative program was drawn with the National Census and Statistics Office (NCSO) now National Statistics Office (NSO) whereby that Office shall provide basic tabulation on births and deaths thereby making it possible for the Health Intelligence Service to discontinue its collection and mechanical processing of such data. Raw data on births, deaths and fetal deaths were taken from the said Office. The basis of the registration of vital events is Act No. 3753 otherwise known as the Civil Registry Law. By virtue of Commonwealth Act 591, the Director of the Bureau of Census and Statistics (now the Administrator of the National Statistics Office) concurrently is the Civil Registrar-General and all local civil registrars are under his supervision. In the cities, the local civil registrars are the officials designated in their respective city charters generally the City Health Officers, while in regular municipalities and municipal districts, the local civil registrars are the municipal treasurers and municipal district treasurers, respectively. Each vital event is registered in the office of the civil registrar of the locality where the event occurred and a copy of each document is sent to the Office of the Civil Registrar-General within the first ten days of the succeeding month.

2. NOTIFIABLE DISEASES STATISTICS

Data on Notifiable Diseases is based on information submitted by different RHUs, CHOs field health personnel. The Law on Reporting of Notifiable Diseases (Act 3573) provides that any cases of Notifiable Diseases shall be reported immediately to the nearest health officer. All field health officers by means of established reporting mechanism (Memorandum Order No. 51-a.s. 1960) submit through the Provincial and City Health Officers, collective morbidity reports (W1-a, W1-b) weekly to the Health Intelligence Service where such data received are then edited, classified, compiled, analyzed and interpreted.

3. POPULATION STATISTICS

The official population estimates since 1931, as computed by the National Statistics Office, using the geometric method are presented in this report. The bases for the yearly population figures are the censuses of 1918, 1939, 1948, 1960, 1970, 1975, 1980 and 1990. In 1980, the Philippine population was pegged at 48,098,460 with an annual growth rate of 2.71 percent. Then, in 1990 the Census of Population and Housing registered a total population of 60,703,206 which recorded a 2.35 percent average annual growth rate, lower by 0.36 percent from the 1980 level. By population size, the Philippines ranked ninth in Asia and Thirteenth largest in the world. The steady increase in the country's population could be attributed to the increasing number of live births and stable death rates resulting in a progressively growing natural increase.

B. CLASSIFICATION OF DATA

Classification of health statistics and population statistics must be made according to the similarly defined system and tabulated in comparable groups in order to make use of the principal value of both data. Thus, variables common to both, i.e., geographic area, age and sex have been similarly classified and tabulated in this report.

1. GEOGRAPHIC CLASSIFICATION

Livebirths; deaths from all causes; infant, maternal and fetal deaths; and data on notifiable diseases have been classified by place of occurrence-region, province and city - the first being a geographical division created as a result of the reorganization of the Department of Health and other two being political divisions of the country. There are fourteen (14) regions, seventy five (75) provinces and sixty (60) cities. There is no classification of the place of occurrence as to whether it is rural or urban because of the lack of standard criteria.

2. AGE

There is no valid information with regard to the accuracy of age of a reported morbid case. Regarding the registered deaths, the age of deceased is fully determined by the date of birth. However, some of the vital records are filled with the age not recorded or the data of birth not indicated. Thus, misstatement of age on vital records may be assumed to some degree. The age classification used in this report is consistent with those recommended for international use by the World Health Organization.

3. DISEASES AND CAUSES OF DEATHS

Morbidity and mortality statistics published by the Department of Health are classified and tabulated in accordance with the International Classification of Diseases, Injuries and Causes of Death, 9th Revision. In this report, the 3-digit classification was used for morbidity as well as for total mortality statistics, while the 2-digit classification was used for fetal deaths.

4. SEX

Classification by sex is made in relation to other factors such as age, nationality, date and place of occurrence. Thus, some tabulations presented in this report may be considered as four-fold tables with sex as one of the attributes of classifications.

C. ANALYSIS AND INTERPRETATION OF DATA

Vital statistics are essential in planning, operating and evaluating programs on health, transport, agricultural production, employment, housing, among others. They are very useful for a variety of administrative and research purposes. However, they cannot correctly be interpreted unless pertinent qualifying factors are taken into consideration.

Some of the factors limiting the use of statistical data emanate from discrepancies in the original records or from the impracticability of tabulating these data in very detailed items. While these defects do exist, nevertheless, the value of these data for original purposes is indispensable. The exact evaluation of health statistics or the analysis of small differences necessitates careful study of a variety of related elements. However, the major trends and differences may not be altered materially by finer analysis.

1. SMALL FREQUENCIES

The number of births and deaths reported for an area or community, or the number of ailments, represents complete counts of such events. Such being the case, they are not subject to sampling errors although they are subject to errors in the registration process or reporting system. When data is used for analytical purposes, as for example, the comparison of rate over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have risen under the same circumstances. In accordance with certain statistical assumptions, the probable range of values may be estimated from the actual figures.

2. COMPUTATION OF STATISTICAL INDICES

In the computation of statistical indices for the Philippines and each health region, province and city, the standard formulae are used. Thus, the crude birth and death rates are computed per 1,000 population; the infant, neonatal, maternal and fetal death rates are per 1,000 livebirths; and the specific diseases morbidity and mortality rates classified either by age, age and sex are computed per 100,000 population.

3. COMPLETENESS OF REGISTRATION AND NOTIFICATION

In the Philippines, although the law provides for a compulsory registration of births, deaths and fetal deaths (Act. 3753) and the reporting of Notifiable Diseases (Act 3573) there are deficiencies in the observance of the law due to a variety of factors. In the interpretation of these data, caution must be observed as the data were not adjusted for underregistration or underreporting. Marked fluctuations in vital events totals for some specific areas do not necessarily reflect differentials in fertility or mortality level but rather could be indications of variations in registration coverage. In the case of notifiable diseases, the source of data are the RHUs and BHs in the country, thus cases identified or confirmed in hospitals and other private facilities are not included in the report. Completeness in the reporting of Notifiable Diseases varies greatly by disease and by area. In general and from all indications, reporting is apparently incomplete.

4. POPULATION BASES

Prior to this report, the National Statistics Office (NSO) conducted the latest census of population and housing in May 1990. The NSO Population estimates based on the results of the 1990 Census of Population and Housing (CPH) were used as the official population estimates for the computation of the different

indicators used in this report. However, because of the urgency of releasing the Philippine Health Statistics, we estimated the 1991 to 1995 provincial population using the exponential formula for estimating the rate of growth following the trend in the rate of growth from 1970-1990. Estimates will be subject to change once the 1995 Population Census has been validated and finalized by the National Statistics Office.

1994 provincial figures were observed by interpolating linearly the official quinquennial 1990 and 1995 figures. The corresponding city population figures were calculated by assuming the proportionate share of a given city to the total provincial figures (Census on Population and Housing) Report No. 3; 3-41 - Socio-Economic and Demographic Characteristic. The under-one values were also based on the proportionate distribution based on the 1990 census figures.

Fig.7

NATALITY STATISTICS

All birth statistics tabulated and presented in this report are based on information received by the Office of the Civil Registrar General from all Local Civil Registrars throughout the country. The registration of birth is done where the delivery took place or where the birth occurred.

A total of 1,643,707 births were registered in 1994. This indicates a corresponding rate of 24.0 births per 1,000 population. Present figures, however, do not represent the actual number of babies born per year because of underregistration.

BIRTHS BY PLACE OF OCCURRENCE - Geographical distribution of livebirths (Table 5) shows that majority (278,079 or 16.9%) of the total registered livebirths were born in the Metropolitan Manila Area (NCR), followed by Region IV (Southern Tagalog) with 253,933 or 15.4% and Region III (Central Luzon) with 177,388 or 10.8%. On the contrary, the least birth total were reported in ARMM, CAR and Region XII with 7,673 or 0.5%; 29,707 or 1.8%; and 44,720 or 2.7% respectively.

LIVEBIRTHS BY MONTH OF OCCURRENCE - Table 6 features the number of registered livebirths by month of occurrence. In 1994, the most livebirths occurred in October (151,865 or 9.2%) followed closely by December (147,990 or 9.0%) and September (147,295 or 9.0%). Meanwhile, the least monthly totals were posted in February and April (120,093 or 7.3% and 123,117 or 7.5% respectively).

LIVEBIRTHS BY AGE OF MOTHER - Table 11 shows that the most number (474,221 or 28.9%) of registered livebirths occurred to mothers who were of age group 25-29 years. Those born to mothers in the 20-24 age bracket came next with a total of 468,318 or 28.5%, while those born to mothers of age group 30-34 placed third numbering 332,084 or 20.2%.

LIVEBIRTHS BY ATTENDANT OF BIRTH - More than half of the national count were births attended by medically trained personnel such as physicians, nurses and midwives (1,001,238). Those attended by traditional midwives or the so called "hilots" numbered 625,472. Among the regions NCR reported a high number of medically attended births (247,157). Three other regions namely, Region IV, Region III and Region VII showed more than half of their total recorded births were attended by medically-trained personnel - 144,840; 142,922; and 87,255 respectively. These regions have key cities and various medical institutions, health centers and medical facilities. The rest of the regions had births mostly attended by unlicensed midwives. This may be due to inaccessibility of health centers and few medical personnel in their areas.

BIRTHS BY SEX - The increase in sex ratio as shown in Table XII revealed an increasing proportion of male births. There were 859,192 male births against 784,515 female births or a sex ratio of 109 males to 100 females.

TREND OF CRUDE BIRTH RATE

The Crude Birth Rate (CBR) indicates the state of population growth in the country. The number of livebirths registered and the corresponding birth rate from 1948 to 1994 is shown on Table 4.

In 1948, the Crude Birth Rate (CBR) went down to 31.5, went up again the following year and remained stable till 1952. From 1953 to 1959, an average rate of 30 births per 1,000 population prevailed. After this period a declining trend in CBR was observed. However, from 1960 a declining trend was observed up to 1972. Only to increase again from 1973 (26.1) to 1980 (30.2). The rates from 1981 to 1993 showed a declining trend except for 1983 and 1987. For 1994, the crude birth rate is 24.0 as compared to 25.1 in 1993, a difference of 1.1 which can be considered not vital due to population change.

BIRTH BY ATTENDANT - Of the total births registered for 1994 (1,643,707) only 1,001,238 (60.9%) had the benefit of medical attendance, as shown in Tables 9 and 10. The NCR registered the highest medically attended deliveries at 88.9% and Region X had the lowest medically attended deliveries at 41.6%.

BIRTH BY AGE OF MOTHER AND NUMBER OF LIVING CHILDREN - Table 12 shows the number of living children relative to the age of the mother. Excluded from this category were children born alive but who died before the delivery of the latest child. Generally, the number of living children increases as the age of the mother increases.

GENERAL FERTILITY RATE

Fertility is a demographic phenomenon greatly responsible for setting population trends. The fertility of a country is measured in terms of total number of livebirths per 1,000 population female population of child-bearing age (15-49 years). In 1994, the female population of such group is 17,415,142 while the total livebirths registered was 1,643,707 with a general fertility rate of 94.4 which is lower than that of the previous year (99.2).

NOTIFIABLE DISEASES STATISTICS

The statistics on Notifiable Diseases presented and analyzed in this report were collected from the Weekly Report of Notifiable Diseases (W-1b) received weekly from all provincial and city health offices throughout the country.

In accordance with Act 3573 (Law on Reporting of Communicable Diseases), the Department of Health mandates the reporting of the following diseases preferably within 72 hours of occurrence of the case: Accidents, AIDS/HIV Infection, Bronchitis, Cholera, Chickenpox, Dengue H-Fever, Diarrheas, Diphtheria, Diseases of the Heart, Dysentery, Filariasis, Infectious Hepatitis, Influenza, Leprosy, Malaria, Malignant Neoplasms, Measles, Pneumonias, Poliomyelitis, Schistosomiasis, Syphilis, Tetanus Neonatorum, Typhoid and other Salmonella Infections, TB Meningitis, TB other forms, Whooping Cough and other diseases with unusual occurrence.

NATIONAL PROFILE: LEADING CAUSES OF MORBIDITY - The ten (10) Leading causes of morbidity in 1994 are shown in Table 13 and Figure 10. Out of the top ten (10) causes of morbidity, three (3) are Respiratory Diseases, namely; Bronchitis, Pneumonias and Tuberculosis occupying the second, fourth and sixth positions respectively. Ranking first in the list is Diarrheal Diseases with a total of 1,376,669 or 2,006.1/100,000 population. There are three (3) diseases due to viral infection - Influenza, Measles and Varicella which occupied the third (3rd), eighth (8th) and ninth (9th) places respectively. One disease is parasitic in etiology - Malaria which is in the tenth (10th) position with a total of 58,615 or 85.4/100,000 population. The rest are Diseases of the Heart with 141,594 or 206.3/100,000 population and Accidents with 211,288 or 307.9/100,000 population.

REGIONAL MORBIDITY DIFFERENTIALS - The notifiable diseases were evenly distributed throughout the country with a few exceptions. There are large variations in morbidity rates by type of morbid condition among regions. Morbidity differentials for certain endemic areas such as Malaria and Schistosomiasis show that Malaria is concentrated in Cagayan Valley and in some regions of Mindanao while Schistosomiasis is concentrated in Eastern Visayas and in a few Mindanao regions. As shown in Table 15, practically the same disease problems were present in the 14 regions of the country.

LAW ON REPORTING OF COMMUNICABLE DISEASES
(Act No. 3573)

No. 3573 - An Act Providing for the Prevention and Suppression of Dangerous Communicable Diseases and for Other Purposes.

Be it enacted by the Senate and House of Representatives of the Philippines in Legislature assembled and by authority of the same.

SECTION 1. Prophylactic inoculation - For the purpose of preventing and suppressing dangerous communicable diseases, any person may be inoculated, administered or injected with prophylactic preparations of recognized efficiency and standard, and no person shall refuse to permit or receive such inoculation, administration or injection as to hinder or obstruct in any way such protective measures as maybe deemed advisable by the Director of Health or his authorized representative.

SECTION 2. Notice to the Philippine Health Service about Communicable Diseases - Every physician, director, superintendent or person in charge of a hospital, institution or dispensary having knowledge of, or any householder tenant, or occupant of any building, or director of college, convent, disease shall immediately notify the nearest health station either by telephone, by messenger or by written notice specifying the disease and the name and address of the person affected.

SECTION 3. A case reportable or communicable disease defined - The term - A case of reportable or communicable disease, for the purpose of the act, shall be held to include any person sick of, or affected or attacked by the following diseases: Actinomycosis, Acute anterior (adult or infant), Cerebrospinal meningitis (epidemic), Diphtheria, Food Poisoning, Glanders, Influenza, Leprosy, Malaria, Measles, Plague, Pneumonia, Mumps, Fever, Typhus fever, Variola or Smallpox, Variloid, Varicella, Vincent's angina, Whooping cough, and Yellow fever and shall further include any other diseases publicly declared by the Director of Health to be communicable and dangerous to public health.

SECTION 4. Penalties - Any person who shall violate any provision of this Act shall be punished by a fine of not more than P100.00.

SECTION 5. This Act shall take effect on approval.

APPROVED: November 26, 1929

MORTALITY STATISTICS

Mortality refers to deaths as a component of population change. Demographic studies reveal that in countries undergoing rapid population increase, it is mainly a sharply declining death rate rather than an increasing birth rate that rings about population explosion. The Philippines has continuously exhibited a stable death rate from the seventies to the early part of the eighties, thus attributing an increase birth rate for the country's fast population growth.

The statistical information in this report is based on data compiled from the death certificates submitted by the Local Civil Registrars throughout the Philippines to the Office of the Civil Registrar General. Registration of death is done in the place of occurrence and not according to the place of residence of the deceased. Reports from the local civil registrars are submitted to the National Statistics Office which releases data on causes of death using the ICD-9 classification of diseases to the Health Intelligence Service. Total deaths registered for 1994 were 321,440 representing a crude death rate of 4.7/1,000 population. The state of health is also of interest in the study of mortality. The ten (10) leading causes of deaths in 1994 are presented in Table 20. Since 1990, Diseases of the Heart has been the number one cause of death representing 15.7 % of total deaths. This is followed by Diseases of the Vascular System and Pneumonias representing 12.2% and 8.8% of total deaths respectively. The rest according to rank are malignant Neoplasms (8.7%), Tuberculosis, All Forms (8.5%), Accidents (4.6%), Chronic Obstructive Pulmonary Diseases and Allied Conditions (3.5%), Diarrheal Diseases (2.6%), Other Diseases of the Respiratory System (2.0%), and Diabetes Mellitus (1.9%). It is to be noted that Diabetes Mellitus emerged as one of the top ten causes of death only this year. This may be attributed to changing lifestyle of Filipino in recent years.

GENERAL MORTALITY TRENDS

Table 4 and figure 4 show the trend of crude death rate for the country from 1948 to 1994. A marked decline in this rate from 12.2%/1000 population in 1948 to 4.7/1,000 population in 1994 is observed. Death rates by age tend to be very high at infancy and early childhood, then decline sharply by age 10 years remaining low over a broad age range, then begin to climb at around age 40 years and accelerate beyond 50 years and over. Table 17 shows that there is a lesser chance of survival during infancy than in subsequent years of childhood and young adulthood. In 1994, a total of 31,073 deaths under one year of age was recorded accounting for 9.7% of the total deaths for the year. Deaths at the ages 70 years and over also figure prominently comprising 32.4% or a total of 104,270. The mortality rate for males was 5.6 per 1,000 male population while that of females was 3.8 per 1,000 female population. More male deaths were accounted for than female deaths with a ratio of 148.0. Death sex ratio is computed by dividing the number of male deaths by the number of female deaths multiplied by 100. Moreover, male deaths were more than twice the female deaths for ages 20 to 49 years. This could possibly mean that at age level below 70, females usually outlive the males.

DEATHS BY CAUSE AND ATTENDANCE

Data on deaths by cause are compiled in accordance with the Ninth Revision of the International Classification of Diseases, Injuries and Causes of Death. On the other hand, deaths by attendance are classified into a) attended, when the deceased was attended to by a physician or medically trained personnel during his illness or injuries at a specific period indicated in the death certificate and b) not attended, if the first condition is not met or satisfied. In 1994, there were 144,208 or 44.9% attended deaths while 177,232 or 55.1% were not attended.

MATERNAL MORTALITY

Maternal Mortality is death of pregnant woman due to pregnancy, childbirth or puerperium. Maternal Mortality Rate (MMR) is the number of deaths among women during pregnancy, childbirth and puerperium per 1,000 livebirths. In 1994, there were 1791 maternal deaths registered with a rate of 0.8 per 1,000 livebirths. This rate is slightly lower than that of the previous year. (0.9).

MATERNAL MORTALITY BY CAUSE

There are five (5) main causes of maternal mortality. The number one cause of maternal mortality is Other complications related to pregnancy occurring in the course of labor, delivery and puerperium with 711 deaths representing 39.7% of all maternal deaths. This is followed by Hypertension complicating pregnancy, childbirth and puerperium with 388 deaths or 21.7%, then Postpartum Hemorrhage with 354 deaths or 19.8 % of all maternal deaths respectively. The last two main causes are Pregnancy with Abortive Outcome and Hemorrhages related to pregnancy with 206 deaths or 11.5% and 132 deaths or 7.4% of all maternal deaths respectively. As shown in Table 5, Region 4 recorded the highest mortality with 265 deaths or 1.0% followed by Region 5 with 195 deaths or 1.7% of all maternal deaths. Deaths among pregnant women aged 30-34 years accounted for 389 deaths followed by aged 25-29 years with 371 deaths.

INFANT MORTALITY

Infant Mortality refers to death among babies less than one year old. Data for 1994 showed that there were 31,073 registered infant deaths or 9.7 % of the overall deaths. The ten (10) leading causes of deaths under one year are shown in Table 28. For the past several years, Pneumonias caused the most number of infant deaths however, for 1994 Respiratory Conditions of Fetus and Newborn topped the leading cause of death with 5,854 deaths or 18.8% of total infant deaths. Pneumonias is second with 5681 deaths or 18.3% of total infant deaths. This is followed by Congenital Anomalies and Diarrheal Diseases with 2,890 deaths or 9.3% and 1927 deaths or 6.2% of total infant deaths respectively. The remaining causes of infant deaths according to rank are Birth Injury & Difficult Labor (1690 deaths), Septicemia (844 deaths), Meningitis (533 deaths)

Avitaminoses & other Nutritional Deficiency (530 deaths), Other Diseases of respiratory System (439 deaths) and Measles (348 deaths). Table 5 shows infant mortality rates for different health regions, provinces and cities all over the country. National Capital Region (NCR) showed the highest rate of 3.9/1,000 livebirths. Among the provinces Northern Samar registered the highest infant death rate of 60.5/1,000 livebirths while Tawi-Tawi registered the lowest rate of 6.8/1,000 livebirths which may be due to under reporting. Among the cities Canlaon City had the highest rate of 50.8/1,000 livebirths while Bais City had the lowest rate of 14.4/1,000 livebirth.

INFANT MORTALITY BY AGE

Of the total 31,073 infant deaths registered in 1994, 16,350 deaths were under 28 days (Neonatal deaths) with a rate of 9.9/1,000 livebirths while 14,723 deaths accounted for those 28 days to under one (1) year (Post Neonatal Deaths) with a rate of 9.0/1,000 livebirth. Deaths in the age group of 0-6 days (Early Neonatal) totalled 12,801 representing 41.2% of all neonatal deaths while the age group 21-27 days recorded the least with 621 deaths representing 2.0% of all neonatal deaths. Of the post-neonatal deaths, those of age 28-59 days had the highest percentage (8.9%) of the total infant deaths. As in the past, there were more male deaths under one year of age than females.

FETAL DEATHS

Fetal deaths is death of an offspring prior to its complete expulsion or extraction from the womb regardless of the duration of pregnancy. It includes abortion, miscarriages and stillbirths. The number of fetal deaths registered was 9,291 or 2.9% of the total registered deaths. Among the regions, Region IV had the highest recorded fetal deaths with 2,163 or 23.3% of all fetal deaths followed by NCR with 1,112 or 12.0% of all fetal deaths. Fetal deaths attended by physicians, nurses and midwives totalled 929 or 61.3% while unlicensed midwives attended to some 202 fetal deaths or 13.3%. Some 25 or 1.6% were attended by other attendants. A total of 2,273 or 24.6% of all fetal deaths occurred among mothers aged 25-29 years old followed by 2,110 or 22.8% of all fetal deaths among mothers 20-24 years old. Surprisingly there were 4 or 0.04% of all fetal deaths that occurred among women less than 15 years old.

LATE FETAL DEATHS

Fetal Deaths occurring after the 27th week of pregnancy is called Late Fetal Death. Late fetal deaths numbered some 3,956 or 1.2% of all total deaths. Mothers aged 25-29 accounted for the highest number of late fetal deaths (1,011) followed by mothers aged 20-24 and 30-34 with 824 and 837 late fetal deaths respectively.
