FOREWORD

The Department of Health (DOH) is proud to present the 1995 PHILIPPINE HEALTH STATISTICS, a documentation of reports on births, deaths and notifiable diseases registered and reported in 1995. The health statistics generated herein are primarily intended for decision-makers, policy makers, planners, researchers and the academe.

The National Statistics Office provided the data on births and deaths, as well as population estimates. On the other hand, data on notifiable diseases were collected through the field health offices. The information from these two sources have been summarized, analyzed and interpreted for easy use. Tables and graphs were also constructed to facilitate straightforward understanding and interpretation of data.

This edition consolidates the efforts of many people in different government agencies across the country. My most sincere gratitude is extended to the local health workers at the barangay, municipal, city and provincial levels; the staff of the National Epidemiology Center, Department of Health and support units at the regional health offices and the National Statistics Office.

To : The Undersecretaries, Assistant Secretaries,
Regional/Bureau Service/ Project Directors, Chief of
Offices/Special Hospitals, Specialty Hospitals and Other
Concerned.

Subject: NSCB Resolution No. 1-96 from the National Statistical
Coordination Board.

Enclosed for information, ready references and
guidelines is a copy of the NSCB Resolution No. 1-96 re: Adoption
of the Infant Mortality Rates, Child Mortality Rates, Underfive
Mortality Rates and Maternal Mortality Ratios, 1990-1995 as
interim estimates at the National, Regional, Provincial and City
levels.

Please be guided accordingly.

CARMENCITA NORIEGA-REODICA, MD, MPH, CESO II
Secretary of Health

NSCB RESOLUTION NO. 1-96

ADOPTION OF THE INFANT MORTALITY RATES, CHILD MORTALITY RATES, UNDER-FIVE MORTALITY RATES AND MATERNAL MORTALITY RATIOS, 1990-1995 AS INTERIM ESTIMATES AT THE NATIONAL, REGIONAL, PROVINCIAL AND CITY LEVELS

WHEREAS, the Technical Working Group on Maternal and Child Mortality (TWG-MCM) then Task Force on Infant Mortality was tasked to generate estimates on infant mortality rates (IMRs), child mortality rates (CMRs), under-five mortality rates (U5MRs) and maternal mortality ratios (MMRs) at the national, regional, provincial and city levels for the period 1990-1995;

WHEREAS, in undertaking the task, the TWG-MCM has tapped all relevant data sources such as the Field Health Service Information System (FHSIS), the Vital Registration System (VRS), the 1993 Listing of Households (HH List) in the sample barangays of the Integrated Survey of Households by the National Statistics Office (NSO) and the 1993 National Demographic Surveys (NDS);

WHEREAS, the TWG came out with recommended mortality estimates at the national, regional, provincial and city levels for the 1990-1995 using the methodology detailed in the Technical Notes;

WHEREAS, the TWG-MCM presented the methodology and the estimated to the Technical Committee on Population and Housing Statistics (TC-PHS) in its meeting held 19 November 1995;

WHEREAS, the TC-PHS subsequently endorsed the methodology and the estimates of the IMRs, CMRs, U5MRs and MMRs, 1990-1995 at the national, regional, provincial and city levels to the NSCB for its approval;

WHEREAS, in its meeting held 5 February 1996, the NSCB Board approved the methodology and the estimates of IMRs, CMRs, U5MRs and MMRs, 1990-1995 at the national, regional, provincial and city levels as official interim estimates;

NOW THEREFORE, BE IT RESOLVED AS IT IS HEREBY RESOLVED THAT the estimates of IMRs, CMRs, U5MRs and MMRs at the national, regional provincial and city levels for the year 1990-1995 as shown in the attached tables be adopted for planning and policy/decision-making purposes as interim estimates until such time that results of new censuses and surveys are made available.

5 February 1996

ATTESTED BY:

ROMULO A. VIROLA
Secretary General

RATES & RATIOS

RATE - In Vital Statistics, a rate shows the relationship between a vital event and those persons exposed to the occurrence of said event, within a given area and during a specified unit of time. It is evident that the persons experiencing the event (the numerator) must come from the total population exposed to the risk of same event (the denominator).

RATIO - It is used to describe the relationship between two (2) numerical quantities or measures of events without taking particular considerations to the time or place. These quantities need not necessarily represent the same entities, although the unit of measure must be the same for both numerator and denominator of the ratio.

CRUDE or GENERAL RATES - These rates are referred to the total living population. It must be presumed that the total population was exposed to the risk of the occurrence of the event.

SPECIFIC RATE - The relationship is for a specific population class or group. It limits the occurrence of the event to that portion of the population definitely exposed to it.

Crude Birth Rate - A measure of one characteristic of the natural growth or increase of a population.

$$\text{CBR} = \frac{\text{Total No. of livebirths registered in a given calendar year}}{\text{Estimated population as of July 1 of same year}} \times 1,000$$

Crude Death Rate - A measure of one mortality from all causes which may result in a decrease of population.

$$\text{CDR} = \frac{\text{Total No. of deaths registered in a given calendar year}}{\text{Estimated population as of July 1 of same year}} \times 1,000$$

Infant Mortality Rate - Measures the risk of dying during the 1st year of life. It is a good index of the general health condition of a community since it reflects the changes in the environmental and medical conditions of a community.

$$\text{IMR} = \frac{\text{Total No. of deaths under 1 year of age registered in a given calendar year}}{\text{Total No. of registered livebirths of same calendar year}} \times 1,000$$

Maternal Mortality Rate - It measures the risk of dying from causes related to pregnancy, childbirth and puerperium. It is an index of the obstetrical care needed and received by the women in a community.

$$\text{MMR} = \frac{\text{Total No. of deaths from maternal causes registered for a given year}}{\text{Total No. of livebirths registered of same year}} \times 1,000$$

Fetal Death Rate - Measures pregnancy wastage. Death of the product of conception occurs prior to its complete expulsion, irrespective of duration of pregnancy.

$$\text{FDR} = \frac{\text{Total No. of Fetal deaths registered in a given calendar year}}{\text{Total No. of livebirths registered of same year}} \times 1,000$$

Neonatal Death Rate - Measures the risk of dying during the 1st month of life. May serve as index of the effects of prenatal care and obstetrical management on the newborn.

$$\text{NDR} = \frac{\text{No. of deaths under 28 days of age registered in a given calendar year}}{\text{No. of livebirths registered of same year}} \times 1,000$$

Specific Death Rate - Describes more accurately the risk of exposure of certain classes or groups to particular diseases. To understand the forces of mortality, the rates should be made specific provided the data are available for both the population and the event in their specifications. Specific rates render more comparable results and thus, reveal the problems of public health.

$$\text{Specific Death Rate} = \frac{\text{Deaths in specific class or group registered in a given calendar year}}{\text{Estimated population as of July 1 in same specified class or group of said year}} \times 100,000$$

Examples:

$$\text{Cause-specific Death Rate} = \frac{\text{No. of deaths from a specific cause registered in a given calendar year}}{\text{Estimated population as of July 1st of same year}} \times 100,000$$

$$\text{Age-specific Death Rate} = \frac{\text{No. of deaths in a particular age group registered in a given calendar year}}{\text{Estimated population as of July 1st in same age group of same year}} \times 100,000$$

$$\text{Sex-specific Death Rate} = \frac{\text{No. of deaths of a certain sex registered in a given calendar year}}{\text{Estimated population as of July 1 in same sex for same year}} \times 100,000$$

Incidence Rate - Measures the frequency of occurrence of the phenomenon during a given period of time. Deals only with new cases.

$$\text{I R} = \frac{\text{No. of new cases of a particular disease registered during a specified period of time}}{\text{Population at risk}} \times 100,000$$

Prevalence Rate - Measures the proportion of the population which exhibits a particular disease at a particular time. This can only be determined following a survey of the population concerned. Deals with total (old and new) number of cases.

$$\text{P R} = \frac{\text{No. of new and old cases of a certain disease registered at a given time}}{\text{Total no. of persons examined at same given time}} \times 100$$

Attack Rate - A more accurate measure of the risk of exposure. Useful in epidemiological investigations.

$$\text{A R} = \frac{\text{No. of persons acquiring a disease registered in a given year}}{\text{No. exposed to same disease in same year}} \times 100$$

Proportionate Mortality (Death Ratios) - Shows the numerical relationship between deaths from a cause (or groups of causes), age (or groups of age) etc. and the total no. of deaths from all causes in all ages taken together. Not a measure of risk of dying.

$$\text{P M} = \frac{\text{No. of registered deaths from a specific cause or age for a given calendar year}}{\text{No. of registered deaths from all causes, all ages in same year}} \times 100$$

Adjusted or Standardized Rates - To render the rates of 2 communities comparable, adjustment for the difference in age, sex, race and any other factors which influence vital events have to be made.

2 methods:

- a) By applying observed specific rates to some standard population
- b) By applying specific rates of standard population to corresponding classes or groups of the local population.

Case Fatality Ratio - Index of the killing power of a disease. It is influenced by incomplete reporting and poor morbidity data.

$$\text{CFR} = \frac{\text{No. of registered deaths from a specific disease for a given year}}{\text{No. of registered cases from same specific disease in same year}} \times 100$$

5-9; 10-14 years), Rate/100,000 Population,
Philippines, 1995 226

INTRODUCTION

A. SOURCES OF DATA

1. *Live Birth, Death and Fetal Death Statistics*

Effective March, 1973 a collaborative program was drawn with the National Statistics Office (NSO) whereby that Office shall provide basic tabulation on births and deaths thereby making it possible for the Health Intelligence Service (HIS) to discontinue its collection and mechanical processing of such data. Raw data on births, deaths and fetal deaths were taken from the said Office. The basis of the registration of vital events in Act No. 3753 otherwise known as the Civil Registry Law. By virtue of Commonwealth Act 591, the Administrator of NSO concurrently is the Civil Registrar-General and all local civil registrars are under his supervision. In the cities, the local civil registrars are the officials designated in their respective city charters generally the City Health Officers, while in regular municipalities and municipal districts, the local civil registrars are the municipal treasurers and municipal district treasurers, respectively. Each vital event is registered in the office of the civil registrar of the locality where the event occurred and a copy of each document is sent to the Office of the Civil Registrar-General within the first ten days of the succeeding month.

2. *Notifiable Disease Statistics*

Data on Notifiable Diseases is based on information submitted by different RHUs, CHOs field health personnel. The Law on Reporting of Notifiable Diseases (Act 3573) provides that any cases of Notifiable Diseases shall be reported immediately to the nearest health officer. All field health officers by means of established reporting mechanism (Memorandum Order No. 51-a.s. 1960) submit through the Provincial and City Health Officers, collective morbidity reports (W1-a, W1-b) weekly to the Health Intelligence Service where such data received are then edited, classified, compiled, analyzed and interpreted.

3. *Population Statistics*

The official population estimates since 1931, as computed by NSO, using geometric method are presented in this report. The bases for the yearly population figures are the censuses of 1918, 1939, 1948, 1960, 1970, 1975, 1980 and 1990. In 1980, the Philippine population was pegged at 48,098,460 with an annual growth rate of 2.71 percent. Then, in 1990 the Census of Population and Housing registered a total population of 60,703,206 which recorded a 2.35 percent average annual growth rate, lower by 0.36 percent from the 1980 level. By population size, the Philippines ranked 9th in Asia and 13th largest in the world. The steady increase in the country's population could be attributed to the increasing number of live births and stable death rates resulting in a progressively growing natural increase.

B. CLASSIFICATION OF DATA

Classification of health statistics and population statistics must be made according to the similarly defined system and tabulated in comparable groups in order to make use of the principal value of both data. Thus, variables common to both, i.e., geographic area, age and sex have been similarly classified and tabulated in this report.

1. Geographic Classification

Live births; deaths from all causes; infant, maternal and fetal deaths; and data on notifiable diseases have been classified by place of occurrence - region, province and city – the first being a geographical division created as a result of the reorganization of the Department of Health and other two being political divisions of the country. There are fifteen (15) regions, seventy six (76) provinces, sixty five (65) cities and three (3) more districts of City of Manila. There is no classification of the place of occurrence as to whether it is rural or urban because of the lack of criteria.

2. Age

There is no valid information with regard to the accuracy of age of a reported morbid case. Regarding the registered deaths, the age of deceased is fully determined by the date of birth. However, some of the vital records are filled with the age not recorded or the date of birth not indicated. Thus, misstatement of age on vital records may be assumed to some degree. The age classification used in this report is consistent with those recommended for international use by the World Health Organization.

3. Diseases and Causes of Death

Morbidity and Mortality statistics published by the Department of Health are classified and tabulated in accordance with the International Classification of Diseases, Injuries and Causes of Death, 9th Revision. In this report, the 3-digit classification was used for morbidity as well as for total mortality statistics, while the 2-digit classification was used for fetal deaths.

4. Sex

Classification by sex is made in relation to other factors such as age, nationality, date and place of occurrence. Thus, some tabulations presented in this report may be considered as four-fold tables with sex as one of the attributes of classifications.

C. ANALYSIS AND INTERPRETATION OF DATA

Vital statistics are essential in planning, operating and evaluating programs on health, transport, agricultural production, employment, housing, among others. They are very useful for a variety of administrative and research purposes. However, they cannot correctly be interpreted unless pertinent qualifying factors are taken into consideration.

Some of the factors limiting the use of statistical data emanate from discrepancies in the original records or from the impracticability of tabulating these data in very detailed items. While these defects do exist, nevertheless, the value of these data for original purposes is indispensable. The exact evaluation of health statistics or the analysis of small differences necessitates careful study of a variety of related elements. However, the major trends and differences may not be altered materially by finer analysis.

1. *Small Frequencies*

The number of births and deaths reported for an area or community, or the number of ailments, represents complete counts of such events. Such being the case, they are not subject to sampling errors although they are subject to errors in the registration process or reporting system. When data is used for analytical purposes, as for example, the comparison of rate over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have rise under the same circumstances. In accordance with certain statistical assumptions, the probable range of values may be estimated from the actual figures.

2. *Computation of Statistical Indices*

In the computation of statistical indices for the Philippines and each health region, province and city, the standard formulae are used. Thus, the crude birth and death rates are computed per 1,000 population; the infant, neonatal, maternal and fetal death rates per 1,000 live births; and the specific diseases morbidity and mortality rates classified either by age, age and sex are computed per 100,000 population.

3. *Completeness of Registration and Notification*

In the Philippines, although the law provides for a compulsory registration of births, deaths and fetal deaths and the reporting of Notifiable Diseases (Act 3573) there are deficiencies in the observance of the law due to a variety of factors. In the interpretation of these data, caution must be observed as the data were not adjusted for underregistration or underreporting. Marked fluctuations in vital events totals for some specific areas do not necessarily

reflect differentials in fertility or mortality level but rather could be indications of variations in registration coverage. In the case of notifiable diseases, the source of data are the RHUs and BHSs in the country, thus cases identified or confirmed in hospitals and other private facilities are not included in the report. Completeness in the reporting of Notifiable Diseases varies greatly by disease and by area. In general and from all indications, reporting is apparently incomplete.

4. Population Bases

The population count, as of September 1, 1995, declared official under Proclamation No. 849 signed by President Fidel V. Ramos on August 16, 1996 was 68,614,162. This number included 2,830 Filipinos living in embassies abroad but excluded Mangyans numbering 2,374. Including Mangyans, the population of the Philippines as of September 1, 1995 was 68,616,536. In keeping with conventional practice in making population projections, this figure was reverse-survived to July 1, 1995 to derive the base population for the 1995 population projections.

Prior to reverse-surviving the 1995 population, five-year census survival ratios and sex ratios were examined. Census survival ratios of less than 1.0 were noted indicating possible undercounts of particular age groups in the 1995 POPCEN or overcounts of adjoining younger age groups in the 1990 CPH. Ratios lower than 1.0 may also be the result of net transfers of population between age groups due to misreporting of ages in the 1995 POPCEN or in the 1990 CPH or in both censuses. Sex ratio analysis revealed a deviation from the expected pattern of declining sex ratios with ages. Assessment of age misreporting using the Myer's Index and the UN Age - Sex Accuracy Index indicated some degree of age heaping or misreporting.

To generate the population for each region, as of July 1, 1995, the proportionate share of each region in the national population as of September 1, 1995 was used. For each region, the proportions of males and of females in each five-year age group to the total population as of September 1, 1995 was multiplied to the total population as of July 1, 1995 to obtain the 1 July 1995 population by age and sex.

To date, there are no separate population projection estimates for CARAGA region because there are no available data on which to base fertility and mortality assumptions. The CARAGA region was not created yet at the time of the conduct of the 1993 National Demographic Survey. However, estimates for CARAGA will be made during the preparation of the provincial population projections. Projections for the provinces covered by CARAGA will be grouped to come out with estimates for this region.

NATALITY STATISTICS

All birth statistics tabulated and presented in this report are based on information received by the Office of Civil Registrar General from all Local Civil Registrars throughout the country. Births are registered where the delivery took place or where the birth occurred.

In 1995, a total of 1,645,043 births were registered with a rate of 24.0 births per 1,000 population. The figures do not reflect the actual number of babies born per year because of underregistration.

BIRTHS BY PLACE OF OCCURRENCE- Geographical distribution of livebirths (Table 5) shows that majority (290,890 or 17.7%) of the total registered livebirths were in the National Capital Region, followed by Region IV (Southern Tagalog) with 256,911 or 15.6% and Region III (Central Luzon) with 180,186 (10.9%). On the otherhand, the least registered total livebirths were reported in ARMM, CAR and Region XII with 7,256 (0.4%); 29,592 (1.8%); and 42,836 (2.6%) respectively.

LIVEBIRTHS BY MONTH OF OCCURRENCE- Table 6 shows the number of registered livebirths by month of occurrence. In 1995, most livebirths occurred in September (153,076 or 9.3%), closely followed by the month of October with 151,857 or 9.2% and August with 142,929 or 8.7%. Meanwhile, the least total monthly livebirths was registered in the month of February with 113,432 or 6.9%.

LIVEBIRTHS BY AGE OF MOTHER- Table 11 reveals that the most number (482,926 or 29.4%) of registered livebirths occurred to mothers in the age group 25-29 years. Mothers with the second most number of registered livebirths are those in the 20-24 years age bracket with 456,373 or 27.%. There were also a total of 809 registered livebirths occurring in mothers in the age group 50 years and over.

LIVEBIRTHS BY ATTENDANT OF BIRTH- More than half (62.7%) of the total registered livebirths were attended by medically trained personnel such as physicians, nurses and midwives. There were 36.3% livebirths attended by traditional midwives or the so called "hilots". Among the regions, NCR has the most reported number (259,311 or 89.1%) of medically attended livebirths. On the contrary, Region II recorded the least number of medically attended livebirths (28,322 or 45.4%), it seems that the traditional midwives or hilots are more popular in the region or this may also be due to the inaccessibility of health centers and lack of medical personnel in the area.

BIRTH BY SEX- The increase in sex ratio as shown in Table 8 revealed an increasing proportion of male births. There were 864,423 registered male births against 780,620 registered female births or a sex ratio of 110 males to 10 females.

TREND OF CRUDE BIRTH RATE

The Crude Birth Rate (CBR) indicates the state of population growth in the country. The number of livebirths registered and the corresponding birth rate from 1949 to 1995 is presented in Table 4.

In 1949, the Crude Birth Rate (CBR) was 30.9, the following year it went up to 31.7. From 1950 to 1960 the CBR ranged from 29.4 to 30.9. In 1961, the rate dropped to 27.7. Ten years after, the CBR went down further to 25.4. In 1972, a 24.8 CBR was posted, the lowest recorded since 1949. However, from 1973 to 1976 an increasing trend was observed. From 1977 to 1989 the CBR recorded ranged from 26.0 to 30.7. Beginning 1990 up to 1995 there was a steady decreased in CBR, from 26.3 in 1990 the CBR went down to 24.0 in 1995.

BIRTH BY ATTENDANT- Of the total births registered for 1995 (1,645,043) more than 60% (1,033,258 or 62.7%) were medically attended, as shown in Tables 9 & 10 . The NCR recorded the highest number of livebirths with medical attendance at 89.1% While Region II posted the least number of medically attended deliveries (45.4%).

BIRTH BY AGE OF MOTHER AND NUMBER OF LIVING CHILDREN- Table 12 shows the number of livebirths by age of mother and number of living children. Not included in the report were children born alive but who died before the delivery of the latest child. Of the total 1,645,043 livebirths by mothers in all ages, 475,352 or 28.9 % were delivered by mothers who already have 1 living child. While only 11,126 or 0.6% livebirths were delivered by mothers with 10 or more living children, majority of these mothers belong to the age group 35-44 years .

GENERAL FERTILITY RATE- Fertility is a demographic phenomenon which is very vital for setting population trend. The fertility of a country is measured in terms of total number of livebirths per 1,000 population female population of child-bearing age (15-49 years). In 1995, the female population in the 15-49 age group is 17,314,167 with a total registered livebirths of 1,645,043 and a fertility rate of 95.0 which is slightly higher than that of 1994.

LIVEBIRTHS BY AGE OF MOTHER AND BY SEX **Philippines, 1996**

Fig.9

NOTIFIABLE DISEASES STATISTICS

The statistics on Notifiable Diseases presented and analyzed in this report were collected from Weekly Report of Notifiable Diseases (W-1b) received weekly from all provincial and city health offices throughout the country.

In accordance with **ACT 3573** (Law on Reporting of Communicable Diseases), the Department of Health mandates the reporting of the following diseases preferably within 72 hours of occurrence of the case: Accidents, AIDS/HIV Infection, Bronchitis, Cholera, Chickenpox, Dengue H-Fever, Diarrheas, Diphtheria, Diseases of the Heart, Dysentery, Filariasis, Infectious Hepatitis, Influenza, Leprosy, Malaria, Malignant Neoplasms, Measles, Pneumonias, Poliomyelitis, Schistosomiasis, Syphilis, Tetanus Neonatorum, Typhoid and other Salmonella Infections, TB Meningitis, TB other forms, Whooping Cough and other diseases with unusual occurrence.

NATIONAL PROFILE: LEADING CAUSES OF MORBIDITY- The Ten (10) Leading Causes of Morbidity in 1995 are shown in Table 13 and Figure 10. Bronchitis tops the list with a total of 1,029,796 cases or 1618.3/100,000 population. Two other respiratory diseases are also in the top ten, namely; Pneumonias (4th) and TB All Forms (7th). Diarrheal Diseases ranks 2nd with 860,005 or 1384.5/100,000 population. Occupying the 3rd place is Influenza with 752,040 or 1181.8/100,000 population. Fifth in the list is Accidents which is followed by Diseases of the Heart. Ranking 8th is Malaria while Chickenpox occupies the 9th slot. The 10th leading cause of death in 1995 is Malignant Neoplasm with a total of 46,967 or 73.8/100,000 population.

REGIONAL MORBIDITY DIFFERENTIALS: As shown in Table 15, practically the same disease problems are experienced in the 15 regions of the country. However, there are large variations in morbidity rates by type of morbid conditions among regions. Morbidity rates for Filariasis, Schistosomiasis, H-Fever and Tetanus Neonatorum are highest in Davao Region. Malaria is concentrated in Sulu of ARMM and Kalinga Apayao of Cordillera Administrative Region. Reported cases of Typhoid, Paratyphoid Fever and Other Salmonella Infection, Measles and Varicela are greatest in Cordillera Administrative Region.

LAW ON REPORTING OF COMMUNICABLE DISEASES
(Act No. 3573)

No. 3573 – An Act Providing for the Prevention and Suppression of Dangerous Communicable Diseases and for Other Purposes.

Be it enacted by the Senate and House of Representatives of the Philippines in Legislature assembled and by authority of the same.

SECTION 1. Prophylactic inoculation – For the purpose of preventing and suppressing dangerous communicable diseases, any person may be inoculated, administered or injected with prophylactic preparations of recognized efficiency and standard, and no person shall refuse to permit or receive such inoculation, administration or injection as to hinder or obstruct in any way such protective measures as maybe deemed advisable by the Director of Health or his authorized representative.

SECTION 2. Notice to the Philippine Health Service about Communicable Diseases – Every physician, director, superintendent or person in charge of a hospital, institution or dispensary having knowledge of, or any householder tenant, or occupant of any building, or director of college, convent, disease shall immediately notify the nearest health station either by telephone, by messenger or by written notice specifying the disease and the name and address of the person affected.

SECTION 3. A case reportable or communicable disease defined –the term – A case of reportable or communicable disease, for the purpose of the act, shall be held to include any person sick of, or affected or attacked by the following diseases: Actinomycosis, Acute anterior (adult or infant), Cerebrospinal meningitis (epidemic), Diphtheria, Food Poisoning, Glanders, Influenza, Leprosy, Malaria, Measles, Plague, Pneumonia, Mumps, Typhus fever, Variola or Smallpox, Varicella, Vincent's angina, Whooping cough, and Yellow fever and shall further include any other diseases publicly declared by the Director of Health to be communicable and dangerous to public health.

SECTION 4. Penalties – Any person who shall violate any provision of this Act shall be punished by a fine of not more than P100.00.

SECTION 5. This Act shall take effect on approval.

APPROVED: November 26, 1929

DEATHS BY CAUSE AND ATTENDANCE

Compilation of data on deaths by cause is in accordance with the 9th Revision of the International Classification of Diseases, Injuries and Causes of Death. On the other hand deaths by attendance are classified into a) attended, when the deceased was attended to by a physician or medically trained personnel during his illness or injuries at a specific period indicated in the death certificate and b) not attended, if the first condition is not met and satisfied. In 1995, there were 135,250 (41.7% of the total deaths) attended while 189,147 (58.3% of the total deaths) were not attended.

MATERNAL MORTALITY

Maternal Mortality is death of pregnant woman due to pregnancy, childbirth and puerperium. Maternal Mortality Rate (MMR) is the number of deaths among women during pregnancy, childbirth and puerperium per 1,000 livebirths. In 1995, there were 1,488 maternal deaths registered with a rate of 0.9 per 1,000 livebirths. This rate is slightly higher than that of the previous year which was 0.8.

MATERNAL MORTALITY BY CAUSE

There are five (5) main causes of maternal mortality as shown in Table 31. For 1995, the number one cause of maternal mortality is Other Complications related to pregnancy occurring in the course of labor, delivery and puerperium with 524 representing 35.2% of all maternal deaths. Hypertension complicating pregnancy Childbirth and Puerperium is second with 348 deaths or 23.4% . Closely in third is Postpartum Hemorrhage with 333 or 22.4%. The last two causes are Pregnancy with Abortive outcome with 164 or 11.0% and Hemorrhages related to pregnancy with 119 or 8.0% of the total maternal deaths. As shown in Table 5, Region IV recorded the highest maternal mortality among the regions with 242 or a rate of 0.9/1000 livebirths. Deaths among pregnant women aged 35 – 39 accounted for 349 maternal deaths or a rate of 1.8/1000 livebirths followed by those in the age range 30 – 34 with 334 deaths or a rate of 1.0/1000 livebirths.

INFANT MORTALITY

Infant mortality refers to death among babies less than one year old. Data for 1995 revealed that there were 30,631 registered infant deaths or 9.4% of the total deaths. The Ten Leading Causes of Infant Mortality are shown in Table 29. In 1995, Pneumonia accountable for 6,283 deaths or 20.5% of the total infant deaths regains its top position in the List of Ten Leading Causes of Infant Mortality from being 2nd only to Respiratory Condition of Fetus and Newborn in the previous year. Respiratory condition of fetus and newborn is only 2nd in 1995 accounting for 5,451 (17.8%) infant deaths. Third in the list is Congenital Anomalies which was responsible for 4,002 infant deaths (13.1%). Others in the list in order of ranking are Birth Injury & Difficult Labor (1,716 deaths),

Diarrheal Diseases (1,444 deaths), Septicemia (939 deaths), Meningitis (471 deaths), Avitaminoses and Other Nutritional Deficiency (422 deaths), Other Diseases of the Respiratory System and Measles (398 deaths). Table 5 shows infant mortality rates for different regions, provinces and cities all over the country for 1995. Among the regions, National Capital Region (NCR) showed the highest infant mortality rate with 21.3/1000 livebirths. For the provinces, Northern Samar had the highest rate with 44.7/1000 livebirths while provinces of Lanao del Sur, Sulu and Tawi-Tawi had the lowest rate with 3.9/1000 livebirths. Among the cities, Canlaon City of Region VII registered the highest infant mortality rate of 49.9/1000 livebirths while Sagay City and Santiago City of Regions 6 and 2, respectively reported no case of infant mortality.

INFANT MORTALITY BY AGE:

Of the total 30,631 infant deaths registered in 1995, 16,112 (9.8/1000 livebirths) deaths were under 28 days (Neonatal Deaths) while 14,519 infant deaths (8.8/1000 livebirths) occurred to those 28 days to under one (1) year (Post-Neonatal Deaths). Deaths in the age group of 0 – 6 days (Early Neonatal) totaled to 12,664 (7.7/1000 livebirths) representing 78.6% of all neonatal deaths while the age group 21 - 27 days registered the least number of deaths with 667 or 4.1% of all neonatal deaths. Of the post-neonatal deaths, those in the age group of 28-59 days registered the highest with 9.4% of the total infant deaths. As in the past, there were more male deaths under 1 year of age than females.

FETAL DEATHS

Fetal death is a death of an offspring prior to its complete expulsion or extraction from the womb regardless of the duration of pregnancy. It includes abortion, miscarriages and stillbirths. The number of fetal deaths registered in 1995 was 9,731 or 2.9% of the total registered deaths. Among the regions, Region IV had the highest recorded fetal deaths with 2,205 or 23% of the total fetal deaths followed by the National Capital Region (NCR) with 1,830 (19%). Fetal deaths attended by physicians, nurse and midwives totaled 5,441 or 56% of the total fetal deaths while unlicensed midwives attended to some 1,973 fetal deaths (21%). A total of 94 (0.01%) fetal deaths were attended by other attendants. Fetal death occurrence was highest among mothers aged 25-29 years old with a total of 2,414 (24.8%) followed by mothers in the age group 20-24 with 2,259 (23.2%). Likewise, 11 (0.1%) fetal deaths occurred among mothers less than 15 years old.

LATE FETAL DEATHS

Fetal Death occurring after the 27th week of pregnancy is considered as Late Fetal Death. Late fetal deaths in 1995 totaled to 4,064 or 1.3% of all registered deaths. Late fetal death occurrence was highest among mothers aged 25-29 with 1,021 (25.1%) followed by mothers in the age group 20-24 with 932 (22.9%). The least fetal death occurrence was among mothers less than 15 years old.
